

IOPS RECONCILIATION PROTOCOL

1. **Payload Extraction:** Extract and decompress the payload from the telemetry file to isolate the Base IOPS for each server.
2. **Hamming Amplification:** Extract the numeric integer from the Server ID (e.g., SRV-9 is 9). Calculate the **Hamming Weight** (the total number of '1's in the binary representation of that integer). Multiply the Base IOPS by this Hamming Weight.
3. **Topology Scaling:** Look at the Cluster_Map.jpg. If a server is designated as a **Hexagon** (Edge Node), you MUST multiply its current IOPS by the factor found in the Excel workbook. If it is a **Square** (Core Node), the multiplier is strictly 1.0.
