

Q4 RISK MANDATE

1. Base USD: Calculate by multiplying the Local_Amount by the Standard_FX rate in the Excel workbook.
2. Stress Testing (Visual Rule): Look at the Asset_Risk_Map.jpg. If an asset class is designated as a Red Diamond, it is highly volatile. You MUST multiply its Base USD by the specific asset's "Stress Multiplier" found in the hidden sheet of the Excel workbook. If it is a Blue Circle, the multiplier is 1.0. (This creates the 'Stressed USD' amount).
3. Token Taxation: Base64-decode the Auth_Token. Apply a flat tax on the Stressed USD amount based on the token tier: [TIER-1-HEDGE] = 10% Tax. [TIER-2-SPEC] = 20% Tax. [TIER-3-HEDGE] = 25% Tax. (Final Cost = Stressed USD + Tax).
